

CCTV Survey

Closed Circuit Television Inspection

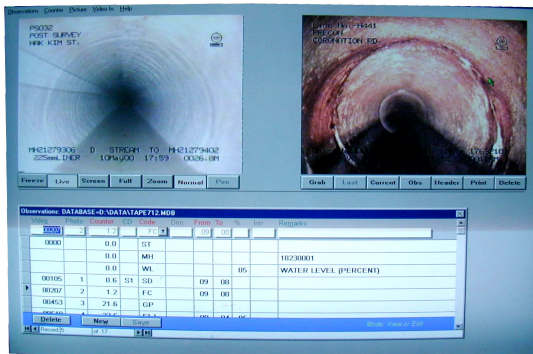

Defective pipeline systems are both costly to maintain and unsatisfactory in performance. Total replacement is invariably out of the question and even the cost of rehabilitation of the whole system may be prohibitive.

However there is a practical and economical solution for overcoming most problems by prioritising rehabilitation through the use of CCTV video inspections.

Our range of colour camera systems includes pan-and-tilt viewing systems, tractors and lightheads providing state of the art viewing in a wide range of pipes.

Accredited CCTV operators analyse and record detailed data of the pipe surveyed. The client is then provided with a videotape of the survey including detailed hard and soft copy of reports.

Pipeline Services techniques and equipment can quickly and accurately :

- Survey the system
- Identify the sections, which are in need of repair
- Recommend and price the appropriate (no-dig) method
- Perform the (no-dig) repair

CCTV Inspections enable asset managers to make informed decisions on their valuable underground assets.
